

TradeInfo MT5 Pro v2.02

Professional MT5 Information Dashboard Indicator

**INSTALLATION • COMPILE • SETTINGS • FIRST TEST • ACCURACY •
TROUBLESHOOTING**

INFORMATION ONLY

This indicator does not open, close or modify trades.

Version 2.02 Installation Documentation

1. What TradeInfo MT5 Pro v2.02 Does

TradeInfo MT5 Pro v2.02 is an MT5/MQL5 information dashboard indicator. It reads account, position and MT5 deal-history information and presents trading statistics directly on the chart. It is not an Expert Advisor and it does not place, close or modify orders.

The dashboard can display account balance/equity information, floating performance, drawdown, spread, long/short position totals, pips, realized profit and period history such as Today, Yesterday, three previous trading days, Week, Month and Year.

2. Files Required

File	Purpose
TradeInfo_MT5_Pro_v2_02.mq5	Main MQL5 indicator source file. Copy this into MQL5/Indicators and compile it in MetaEditor.

3. MT5 Installation - Step by Step

Step 1 - Open the MT5 data folder

Start MetaTrader 5. From the top menu choose **File > Open Data Folder**.

Step 2 - Open the Indicators folder

Inside the data folder open **MQL5 > Indicators**.

Step 3 - Copy the indicator

Copy **TradeInfo_MT5_Pro_v2_02.mq5** into the Indicators folder.

Step 4 - Compile in MetaEditor

Open the MQ5 file in MetaEditor and press **Compile** (normally F7). Check the Toolbox/Errors area. The target is a successful compile with no errors.

Step 5 - Refresh MT5

Return to MT5. In Navigator, right-click **Indicators** and choose Refresh, or restart MT5 if the new indicator is not visible.

Step 6 - Remove the older build

If v2.01 is already attached to the chart, remove it before attaching v2.02. This avoids having two dashboard versions drawing information at the same time.

Step 7 - Attach v2.02

Drag **TradeInfo MT5 Pro v2.02** from Navigator > Indicators onto the desired chart, review Inputs, and press OK.

4. Recommended First-Test Settings

Input	Recommended first test	Meaning
OnlyAttachedSymbol	false	Use complete account information instead of restricting calculations to the chart symbol.
MagicNumber	-1	Include all magic numbers.
CommentFilter	empty	Do not restrict positions/deals by comment.
StartDateFilter	empty	Do not restrict history unless you intentionally want a custom start date.

First test: attach the indicator to a liquid symbol/chart, keep MT5 connected to the broker, and compare Balance/Equity plus current open-position totals with the MT5 terminal. Then compare realized money profit for the same period with MT5 History.

5. v2.02 Accuracy Notes

1. Floating Equity, Current DD, Spread and Long/Short totals refresh on every incoming tick.
2. Realized history uses MT5 exit deals: OUT, OUT_BY and INOUT.
3. Realized money profit includes DEAL_PROFIT + DEAL_SWAP + DEAL_COMMISSION + DEAL_FEE.
4. Entry price used for pips is rebuilt from the complete position history with HistorySelectByPosition(). This helps positions opened before the selected reporting day calculate correctly.
5. Period Gain % reconstructs the balance at the beginning of the period and accounts for deposits, withdrawals, credits and balance operations, reducing distorted gain percentages.
6. History rows include Today, Yesterday, three previous trading days, Week, Month and Year.
7. Profit-history scanning is cached for 10 seconds to avoid unnecessary full-history scans, while live floating/account information can continue refreshing on ticks.

6. How to Validate the First Run

Dashboard appears

The indicator name/data should appear on the chart after attachment.

Balance and Equity

Compare the displayed values with the MT5 Trade/Account information.

Open positions

Check long/short counts, lots and floating money result against currently open MT5 positions.

History periods

Compare Today/Week/Month/Year using the same intended time scope. Remember that the MT5 History tab may itself be filtered.

Cross-symbol pips

When several different symbols are included, pips are mathematically summed. Money profit is generally the more meaningful cross-symbol account statistic.

7. Troubleshooting

Problem	What to check
Indicator is not visible in Navigator	Confirm the MQ5 file is in the active terminal's MQL5/Indicators folder. Refresh Navigator or restart MT5.
Compile error	Open the exact v2.02 MQ5 file in MetaEditor, compile again, and read the first error shown. Make sure you are c
Dashboard does not appear	Confirm the indicator is attached, the chart is open, and MT5 is connected. Remove any old v2.01 instance and a
Values look incomplete	For the first test use OnlyAttachedSymbol=false, MagicNumber=-1, empty CommentFilter and empty StartDateF
History differs from MT5 terminal	Check the date range selected in MT5's History tab. The terminal may be showing a custom range while the indic
Floating values seem delayed	Floating/account figures update on incoming ticks. If the market is closed or no tick arrives, visible live values will
History changes less frequently than live values	This is expected: profit history is cached for about 10 seconds to reduce repeated full-history scanning.

Problem	What to check
Pips do not feel comparable across symbols	Different instruments have different pip/point conventions. Cross-symbol money profit is usually the safer account

8. Safe Usage Notes

TradeInfo MT5 Pro v2.02 is a read-only information/dashboard indicator. It does not open, close or modify trades. Use the dashboard as an analytical display and verify important account figures against your broker terminal when performing audits or making trading decisions.

For marketplace installation support, keep the original v2.02 file name and avoid running the older v2.01 on the same chart at the same time.
